Casino Track

An identification and tracking solution designed specifically for gambling organizations to verify a person's identity, age and listing on any barred self-exclusion database.

Identify Barred Players As They Walk Through The Door

The Casino Track software is an effective solution used by gambling facilities to identify and track players who are listed on voluntary internal or state barred self-exclusion lists. This solution greatly reduces the risk of a player entering the casino or cashing out by verifying their identity as soon as they enter the facility. Gambling organizations are able to increase security and reduce the possibility of paying expensive fines associated with having barred players on their property by using the Casino Track solution.

How It Works

Every player who enters the facility is required to have their driver's license or state issued ID scanned. The information is populated into the Casino Track software and is instantly checked against multiple exclusion databases and identified as either approved or barred. Users are also able to perform a manual search by typing in a person's name. If a match appears based on search criteria, a screen shot of possible violators appear along with their photo. This provides the capability of verifying the identity of an individual before confronting them.
